Tejaswa Rastogi

Blockchain Security Researcher

hello.razzor@gmail.com · razzor.xyz · linkedin.com/in/razzor · github.com/razzor-codes · India, remote or relocation

> **50+ audits · Critical bugs in Linea's verifier · Built zkSync's production FFLONK verifier · DEF CON ×2**

Security researcher specialising in ZK proof verifiers, rollups and bridges. 5+ years across audit firms (Consensys Diligence, QuillAudits) and in-house security teams (Matter Labs, ADI Foundation).

SELECTED WORK

Linea PLONK verifier: found **critical bugs** in the verifier's cryptography, including a broken Lagrange evaluation and an unchecked pairing result. Report

Linea message service: found that a relayer could fail a cross-chain message and **still collect the user's fee**. Report

zkSync FFLONK verifier: wrote it **from scratch**; it verifies zkSync's proofs **in production**. Code

EXPERIENCE

Blockchain Security Engineer · ADI Foundation — Jun 2026 - Nov 2026

- Audited the **smart contracts and zkEVM circuits** in-house, and led security reviews across the organisation's codebases and dApps.
- Ran the **public bug bounty programs** on HackenProof (smart contracts, zkEVM, PredictStreet): validated and triaged reports.
- Wrote the **security guidelines and upgrade policy**, and a P0/P1/P2 tracker of fixes due before each upgrade.
- Pentested the wallets; closed contract and repository issues raised in Aikido.

Lead Security Engineer (Blockchain) · Reckong Tech — Sep 2025 - May 2026

- Designed, built and audited client **smart contract protocols end to end**, from threat model to launch, including a **points and rewards system for airline loyalty programs**.

Security Engineer · Matter Labs (zkSync) — Mar 2024 - Aug 2025

- Audited new and existing **smart contracts and ZK circuits** in-house.
- Led an incident response that **recovered ~$500k** across ZK chains: found every funded address exposed to cross-chain replay by the EVM emulator upgrade, and recovered them atomically with it.
- Wrote zkSync's **FFLONK proof verifier from scratch**; it runs in production.
- Managed Matter Labs' external audits by **OpenZeppelin** (chain contract upgrades) and **Nethermind** (PLONK verifier), through to fixes.
- Shipped TEE attestation contracts built on Automata.

Security Auditor · Consensys Diligence — Jun 2022 - Feb 2024

- Audited rollups, bridges, ZK verifiers and DeFi: **Linea** (PLONK verifier, message service, token bridge), Forta, Gearbox V2.
- Wrote threat models and design recommendations for client teams; shared new attack vectors across the team.

Smart Contract Auditor · QuillAudits — May 2021 - Jun 2022

- Audited smart contracts with manual review, automated and fuzz testing; guided clients through fixes.
- Interviewed candidates for the audit team.

Infosec Instructor · TSPL's Explorium Jul 2018 - May 2019

- Taught programming, networking and cybersecurity.

TALKS

- ZK Verifiers Exposed: Lessons from Real Bugs and Fixes, ETHTaipei 2025
- Quantum Robust Ethereum: What's Next?, Web3Conf Goa 2024
- Smart Contract Phishing: Attack and Defense, c0c0n 2023
- Not So Famous Attack Vectors in Smart Contract Security, ETHDubai, Nullcon Berlin
- Detecting Price Manipulation Attacks, SANS Blockchain Security Summit 2022
- Preventing Sandwich Attacks with Recursive Zero Knowledge Proofs, DEF CON 29
- Verifiable Delay Functions for Preventing DoS Attacks on Ethereum 2.0, DEF CON 28
- Post-Quantum Cryptography and 5G Security, Nullcon 2021
- Modifying Jigsaw to Evade ML Malware Classifiers, Red Team Security Summit 2020

PROJECTS

AI-assisted review pipeline: turns a codebase into ranked audit leads in stages: threat model, scope, code map, brief, a two-model review and a deep pass on the strongest leads. Every lead is checked by hand against the code and live chain state. Tested on real past bugs and used on live Immunefi and HackenProof programs.

Warden: a control layer for AI coding agents (Claude Code, Cursor, Codex). Every file read, shell command and MCP call gets an allow, deny or ask decision from deterministic Cedar policies, with session taint tracking, so an agent can't read secrets or run commands its user wouldn't approve. About 4 ms per call.

ZK Stack Tracer: give it one transaction hash or address and it rebuilds the whole journey across L1 and ZK Stack chains, every hop decoded and timed. TypeScript CLI and web app, 73 offline tests. Demo on request.

DVZKV: a CTF built on real bug classes from my verifier audits: players break deliberately vulnerable PLONK, PLONKish and FFLONK verifiers in Foundry challenges, then prove the solve on-chain to mint a soulbound badge.

SKILLS

Security: Smart contract and ZK circuit audits, ZK proof verifiers (PLONK, FFLONK), rollups and bridges, incident response, threat modelling, bug bounty triage
Tools: Foundry (unit, fuzz and invariant tests), Medusa
Languages: Solidity, Yul, Rust (intermediate), Python, TypeScript

EDUCATION AND CERTIFICATION

BSc Computer Science, Mithibai College, University of Mumbai 2014 - 2017
Certified Ethical Hacker (EC-Council) 2020
Blockchain Security (Infosec) 2020
CCNA CyberOps (Cisco) 2018

COMMUNITY

CipherShastra: founded an open-source platform for learning smart contract security through CTFs (2021).
Unchained: founded an international blockchain security conference (2021).
RazzorSec: founded a blockchain security community for newcomers (2019).
